The electrochemical oxygen reduction reaction (ORR) is one of the most important reactions in the current energy technologies. The low efficiency of the cathode in ORR is still the main bottleneck of the power generation by the fuel cells. With the increased demands for more efficient fuel cells, there is a rising trend for the development of novel catalysts which can achieve high activity for ORR in the alkaline and acidic electrolyte. Here we report a facile synthesis of a metal-organic framework (MOF) with Pd(ii) and Co(ii) coordination sites, which could directly boost the ORR catalytic activity. Compared with the precious metal catalyst, 82157476a†
